Subject:

Sequence search of Application NO: 09/899,513

Please do a standard search on SEQ ID NOS: 1 and 2 against the commercial nucleic acid databases.

Thank you very much!

It currently consists of 3 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be processed.

* consists of 2 contigs. Gaps between the contigs

* are represented as runs of N. The order of the pieces

* is believed to be correct as given, however the sizes

* of the gaps between them are based on estimates that have

* provided by the submittor.

* This sequence will be replaced

* by the finished sequence as soon as it is available and

* the accession number will be preserved.

* the accession number will be preserved.

* 1 16618: contig of 10618 bp in length

* 16619 16718: gap of 100 bp

1 194215: contig of 177497 bp in length.

**20606: gap of 864 bp in length 20607 21487: contig of 881 bp in length 21488 21587: gap of 100 bp 21488 22582: gap of 100 bp 23476 23575: gap of 100 bp 23576 24475: contig of 893 bp in length 2476 24575: gap of 100 bp 24576 2573: gap of 100 bp 2574 25573: gap of 100 bp 2574 26572: gap of 100 bp 2574 26573: contig of 878 bp in length 27451 27550: gap of 100 bp 27551 28440: contig of 878 bp in length 27451 27550: gap of 100 bp 27551 28440: contig of 87551 27550: gap of 100 bp 27551 28440: contig of 87551 27550: gap of 100 bp 27551 27550: gap NOTE: This record contains 141 individual sequencing reads that have not been assembled into sequencing reads that have not been assembled into contigs. Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. However, it should not be assumed that this clone will be sequenced to completion. In the event that the record is updated, the accession number will þe 878 977: gap of 100 bp

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                 Score

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cc spleen cDNA library. Positive clones were sequenced and the discovery of novel GPCRs, and the polynucleotides encoding them, as well as to methods of using the GPCR polypeptides and polynucleotides as targets for diagnosis and treatment of receptor mediated disorders. It also relates to drug screening cc methods using the polypeptides and polynucleotides to identify cc agonists and antagonists for diagnosis and treatment. Methods cof treating a disorder by modulating the level or activity of a cc GPCR nucleic acid, including 15334 nucleic acid, are also claimed, where the disorder is selected from anaemia, neutropenia and cc inappropriate GPCR expression and activity can also be treated, cc e.g. retinitis plymentosum, nephrogenic diabetes insipidus and cc other disorders of the central and peripheral nervous systems.

Like all GPCRs, TGR4 has 7 putative transmembrane domains and is likely to be involved in signal transduction. The invention also relates to vectors and host cells comprising TGR4 nucleotides; the recombinant expression of TGR4; an antibody against TGR4; methods for quantitating TGR4 protein or nucleic acids; and methods of screening for TGR4 ligands or modulators of TGR4 activity or expression. The TGR4 protein, nucleotides encoding it, and antibodies against TGR4 may be used in the diagnosis of diseases of the central nervous system, circulatory system and diagestive system; immunological diseases; inflammation; cancer; and diabetes. They may also be used to develop drugs for the treatment of the above conditions.

AXOR17 polypeptides and polynucleotides can be used in therapy, used to identify compounds, including agonists and antagonists of AXOR17, to diagnose diseases associated with inappropriate AXOR17 levels or activity and used to produce expression systems and recombinant host cells for producing AXOR17. AXOR17 polypeptide and polynucleotides can be used to treat bacterial, fungal, protozoan and viral infections, pain, cancer, diabetes, obesity, anorexia, bulimia, asthma, Parkinson's disease, acute heart failure, hypertension,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated AXOR17 polypeptide is useful for diagnosis and treatment of microbial infections and diseases e.g. cancer, schizophrenia, diabetes, obesity, stroke and myocardial infarction -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 hypotension, urinary retention, osteoporosis, angina pectoris, stroke, myocardial infarction, ulcers, benign prostatic hypertrophy, migraine, vomiting, psychotic and neurological disorders including schizophrenia and depression and dyskinesias e.g. Huntington's disease or Gilles de la Tourette's syndrome. Antibodies to AXOR17 can also be used to treat these diseases. They can also be used in vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 2; Page 32; 35pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                orphan G protein-coupled receptor (GPCR). The full length cDNA was cloned by PCR using hARE-4 specific primers and human genomic DNA as template. The orphan GPCR of the invention, like all GPCRs has seven transmembrane alpha helices with an extracellular N-terminus and an intracellular C-terminus. However, no endogenous ligands has yet been identified for the proteins of the invention. The orphan GPCRs may be used in the identification of their endogenous ligands, and to screen potential GPCR agonists and antagonists for use as pharmaceutical agents. The proteins may also be used in the study of GPCR mediated signalling cascades, and to elucidate their precise role in normal and diseased human conditions. Nucleic acid encoding human orphan GPCRs may be used for tissue localisation expression analysis to provide information about their function in healthy and pathological states.
                                                                                          Human; G protein coupled
identification; agonist;

                                                                                                                                                                                                                                          of a human GPCR. These non-endogenous human GPCRs can be useful for the direct identification of candidate compounds as receptors agonists inverse agonists or partial agonists for use as pharmaceutical agents. AAA46017 to AAA46126 and AAB02825 to AAB02859 represent sequences used the exemplification of the present invention.
                                                                                                                                                                                                                                                                                               The present invention describes transmembrane receptors, preferably human G protein coupled receptors (GPCR). More specifically the present invention relates to non-endogenous, constitutively activated versions
                                                                                                                                                                                                                        Sequence 1119
                                                                                                                                                                                                                                                                                                                                                                      Non-endogenous, human G protein-coupled receptors for screening receptor, inverse or partial agonists useful as therapeutic age
                                                                                                                                                                                                                                                                                                                                                                                                       P-PSDB;

            The present cDNA sequence encodes human ICSR-1 protein which is a member of G-protein coupled receptor (7 transmembrane receptor) family. This receptor is expressed in either human embryonic kidney 293 (HEK 293) cells or adherent dfhr CHO cells. ICSR-1 is useful for treating and diagnosing infections such as bacterial, fungal, protozoan and viral infections, particularly infections caused by HIV-1 or HIV-2, pain,

ICSR-1 cDNA is useful as diagnostic reagent for detecting mutations in the associated gene. ICSR-1 is useful as vaccines for inducing immunological response in a mammal and for screening antagonists and agonists of ICSR-1. It is useful in conventional low capacity screening methods and also in high-throughput screening (HTS) formats. It is also useful for identifying membrane bound or soluble receptors. ICSR-1 is useful for chromosome localisation studies and

The pr1-004 gene is located on CC human chromosome 12p13.3. Also included in the invention is the Pr1-004 CC amino acid sequence. pr1-004 is similar to neurotensin receptors. The Pr1-004 protein, an anti-pr1-004 antibody or a composition comprising CC either the protein or antibody are useful in manufacturing a medicament CC for the treatment of a patient having the need to modulate, antagonise, CC selectively antagonise, or agonise the polypeptide. A Pr1-004 CC polynucleotide may be used to detect and quantify gene expression in CC conditions, disorders, or diseases in which pr1-004 activity may be complicated. Antibodies, compounds and compositions which can modulate the CC implicated. Antibodies, compounds and compositions which can modulate the CC signal transduction, such as in the treatment of obesity, diabetes and CC metabolic disease, neurological disease, psychotherapeutics, urogenital disease, inflammation, cancer, tissue repair, dermatology, skin pigmentation, photoageing, frailty, osteoporosis, cardiovascular disease, gastrointestinal disease, infection, allergy and respiratory disease, CC sensory organ disorders, sleep disorders and hair loss. The present xxx

The CC antibodies and nucleic acid probes as described above can be used to CC detect the presence of the polypeptides and nucleic acids and are used to CC diagnose a variety of diseases or disorders in which GPCRs are involved cc q., Alzheimer's disease, amyotrophic lateral sclerosis, asthma, CC atherosclerosis, basal cell carcinoma, breast carcinoma, cardiomyopathy, CC chondrosarcoma, chronic obstructive pulmonary disease, Cronn's disease, CC multiple sclerosis, osteoparthits, osteoporosis, Parkinson's disease, CC multiple sclerosis, osteoarthritis, schzophrenia, ulcerative colitis, CC tuberculosis and many other diseases listed in the specification. The CC disorders, anorexia, hormonal release disorders, cognition and memory CC disorders, pain perception disorders, obesity, diabetes, Alzheimer's CC disease. Preferably, compounds that decrease or increase ct treat obesity, diabetes, hyperlipidaemia and stroke. The GPCR nucleic acid is the representation of the above mentioned disorders by gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

```
CC nucleic acid molecule that is at least 80% identical to the G protein-coupled (GPCR) polynucleotides included in the specification. Also included are probes based on the GPCR sequences (including CC antisense probes), a host cell comprising an expression vector comprising the GPCR sequence, antibodies raised against the polypeptides. The CC and methods of identifying modulators of the polypeptides. The CC polypeptides are useful for identifying modulator against the polypeptides. The CC polypeptides are useful for identifying modulator compounds which CC function as modulators, activators, repressors, agonists or antagonists of the novel GPCR polypeptides including the GAL4 polypeptide. The CC antibodies and nucleic acid probes as described above can be used to diagnose a variety of diseases or disorders in which GPCRs are involved e.g., Alzheimer's disease, amyotrophic lateral sclerosis, asthma, chronic obstructive pulmonary disease, Crohn's disease, epilepsy, macular degeneration, lymphoma, melanoma, cardiomyopathy, componession, epilepsy, macular degeneration, lymphoma, melanoma, componession, epilepsy, macular degeneration, lymphoma, melanoma, cut uberculosis and many other diseases listed in the specification. The composes and antibodies are also useful for diagnosing cognition and memory disease. Preferably, compounds that decrease or increase alzohion activity disease. Preferably, compounds that decrease or increase alzohion of galanin receptor (GAL4) can be used to treat obesity, diabetes, hyperlipidaemia and stroke. The GPCR nucleic acid is cardiomyopathy.
psoriasis; rheumatoid arthritis; schizophrenia; ulcerative colitis; tuberculosis; cognition disorder; memory disorder; anorexia; hormonal release disorder; cardiovascular activity disorder; pain perception disorder; obesity; diabetes; obesity; diabetes; hyperlipidaemia; stroke; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Alzheimer's disease; amyotrophic lateral sclerosis; asthma; atherosclerosis; basal cell carcinoma; breast carcinoma; cachondrosarcoma; chronic obstructive pulmonary disease; Croh

cDNA. GCREC is useful in somatic or germline gene therapy to correct a condensation of genetic deficiency, to express a conditionally lethal gene product and contract to express a protein which affords protection against intracellular parasites and also for diagnosis of disorders associated with expression of GCREC. GCREC is also useful for generating hybridisation probes useful in mapping the naturally occurring genomic sequences and to create knockin humanised animals (pigs) or transgenic animals (mice or rats) to model human diseases. GCREC is used to diagnose, prevent and treat proliferative disorders (actinic keratosis, arteriosclerosis, cirrhosis, hepatitis and cancer); cancer (breast, bladder, bone marrow, brain, cuterus cancer, leukaemia, adenocarcinoma, lymphoma, melanoma and myeloma) neurological disorders (epilepsy, stroke, Alzheimer's, Huntington's, Parkinson's disease, multiple sclerosis, dementia and other central nervous system disorders); cardiovascular disorders (angina pectoris, hypertension, atherosclerosis, congestive heart failure);
                                                             gastrointestinal disorders (dysphagia, peptic oesophagitis, oesophageal spasm, gastritis, gastric carcinoma, anorexia, nausea, abdominal angina, pyrosis, pancreatitis, Crohn's disease, diarrhoea); autoimmune/
inflammatory disorders (acquired immunodeficiency syndrome (AIDS), Addison's diseases, allergies, anaemia, asthma, diabetes mellitus, atopic dermatitis, glomerulonephritis, Grave's diseases, osteoarthritis, parasitic, protozoal and helminthic infections) and metabolic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 5; Page 160-161; 175pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New human G-protein coupled receptor polypeptides for diagnosing, preventing, and treating cell proliferative, neurological, cardiovascular, gastrointestinal, autoimmune and metabolic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              14-JAN-2000;

The present sequence encodes GPCR9 cometabolic pathway modulation. The present sequence encodes GPCR9 control of the coll signal processing and control of the coll signal processing and control of the coll sequence encodes GPCR9 control of the coll of the coll sequence encodes GPCR9 control of the coll of th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                and the polynucleotides encoding them. The GPCR, its encoding polynucleotide and an anti-GPCR antibody are useful for diagnosing polynucleotide and an anti-GPCR antibody are useful for diagnosing treating or preventing a GPCR-associated disorder in a human e.g. developmental diseases, immune diseases, taste and scent detectability disorder, Burkitt's lymphoma, signal transduction pathway disorders.

                                                                                                                                                                                                                                                                                                                                                                                autoimmune pulmonary inflammation, graft-versus-host disease and conditions, such as asthma and in regulation of haematopoiesis or lymphoid cell deficiencies. The proteins may also have utility in compositions used for bone, carrilage, tendon and/or nerve tissue growth or regeneration as well as wound healing and in the treatment of burns. The proteins may be used in the treatment of periodontal disease and in other tooth repair processes. Other uses include treatment of thrombolytic and haemostatic conditions, treatment or prevention of tumours and inhibiting infection by bacteria, viruses,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to human proteins (AAB61608-AAB61617) and their coding sequences (AAF28679-AAF28698). The proteins of the present invention have hydrophobic domains and can be used for the treatment of

Polynucleotides of the invention are useful as probes for assessing toxicity of test compounds. They are also used in gene therapy. The present sequence is human G-protein coupled receptor 1 (GCREC-1) cDNA.

                                                                                         The invention relates to human G protein-coupled receptor (GPCR) and their corresponding DNA molecules. GPCR is also referred as seven transmembrane receptor. G protein coupled receptor protein is useful for treating neurological disorder, particularly schizophrenia. GPCR protein is also useful for identifying compounds useful for treating schizophrenia. These compounds are also useful for treating other neurological and psychiatric diseases, e.g. depression, anxiety, bipolar disease, affective disorders, attention deficit disorder, epilepsy, neuritis, neurostania, neuropathy, neurosis, Alzheimer's disease, parkinson's disease, migraine and senile
                      neurosis, Alzhelmer's disease, ratalisum subsequence procedures that dementia. The invention also provides genetic screening procedures that entail analysing a person's genome with respect to GPCR. The vectors are useful for the recombinant production of the GPCR's. The present DNA sequence encodes human CON217 G protein-coupled receptor (GPCR) protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; G protein-coupled receptor; GPCR; CON217 protein; schizophrenia; neuroleptic; nootropic; neuroprotective; bipolar disease; psychotropic; neurological disorder; psychiatric disease; neurosis; anxiety; neuritis; attention deficit hyperactivity disorder; neurasthenia; senile dementia; affective disorder; neuropathy; Alzheimer's disease; Parkinson's disease;
                                                                                                                                                                                                                                                                                                                              Seven transmembrane receptor polypeptides and polynucleotides, useful for treating neurological or psychiatric disorders, e.g. schizophrenia, as well as for identifying compounds useful for treating schizophrenia
                                                                                                                                                                                                                                                                                                                           for treating neurological or payoners as well as for identifying compounds
